To analyze the main characteristics of the dataset, we'll examine its structure, data types, summary statistics, and distribution of variables.

```
```python
Import necessary libraries
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns

Examine the structure of the DataFrame
display('DataFrame Shape:')
display(df.shape)

Examine data types of the columns
display('Data Types:')
display(df.dtypes)

Summary statistics for numerical columns
display('Summary statistics for numerical columns:')
display(df.select_dtypes(include=np.number).describe())

Summary statistics for categorical columns
display('Summary statistics for categorical columns:')
display(df.select_dtypes(include='object').describe())

Check the distribution of the target variable 'LUNG_CANCER'
display('Distribution of LUNG_CANCER:')
display(df['LUNG_CANCER'].value_counts())

Check the distribution of 'GENDER'
display('Distribution of GENDER:')
display(df['GENDER'].value_counts())

Plot histograms for numerical columns
display('Histograms for numerical columns:')
plt.figure(figsize=(12,8))
sns.histplot(df['AGE'], kde=True)
plt.title('Histogram of AGE')
plt.show()

Check correlation between numerical variables
display('Correlation between numerical variables:')
corr_matrix = df.select_dtypes(include=np.number).corr()
plt.figure(figsize=(12,10))
sns.heatmap(corr_matrix, annot=False, cmap='coolwarm', square=True)
plt.title('Correlation Matrix')
plt.show()
```
