To determine if there are any missing values in the dataframe, we need to check for null values.

First, import the necessary libraries. In this case, we will need pandas for data manipulation.

```
```python
import pandas as pd
```
```

Now, let's check for missing values.

```
```python
display('Display of missing values:')
display(df.isnull().sum())
```
```

'Display of missing values:'

`dtype: int64`
Since the information provided indicates that there are no missing values, the output will be zero for all columns.

However, to directly answer the question based on the given information:

There are no missing values in any of the columns. The count of missing values for each column is 0, as indicated by the information provided: ``{'Diabetes_012':0, 'HighBP':0, ...}``.
